

This week's task for Zhongtao and I was to implement a body detection algorithm using openCV to find a body in a still image. However, Zhongtao took it a step higher and got an algorithm that implements body detection in a video capture/feed.

Due to the "software" based nature of this week's task, we will attach a copy of the algorithm (which uses OpenCV's library) as a .cpp file and below are the results of using the algorithm for human body detection.
